

Playwright Notes For Demo Web Shop Capstone

Beginner-friendly project notes for the final capstone

1. What This Project Tests

The project tests Demo Web Shop, a public e-commerce demo website. The automation validates guest-user pages and customer-facing flows without using real payment data or private credentials.

2. Playwright Concepts Used

- test and expect from @playwright/test for writing tests and assertions.
- page.goto for opening website routes.
- locators for finding elements on the page.
- toHaveTitle, toContainText, toBeVisible, and toBeEnabled for validation.
- Playwright projects for running the same tests on Chromium, Firefox, and WebKit.
- HTML report and Allure report for result review.

3. Project Structure

Path	Meaning
.github/workflows/allure-report.yml	GitHub Actions workflow for CI/CD and GitHub Pages deployment.
tests/data/serviceScenarios.js	Central data file containing 8 services and 120 scenario definitions.
tests/services/*.spec.js	Service-wise Playwright spec files that execute the scenario data.
tests/support/demoWebShop.js	Shared navigation helper for Demo Web Shop pages.
tests/support/serviceRunner.js	Reusable assertion runner used by all service tests.
playwright.config.js	Playwright browser, reporter, timeout, and base URL configuration.
package.json	Node scripts and project dependencies.
README.md	GitHub project summary and execution information.

4. Service Coverage

Service	Count	Focus
Authentication	15	Login, register, password recovery, guest account protection, header access links
Product and Search	15	Home page, categories, product details, search results, sorting controls
Cart	15	Empty cart, cart progress, add-to-cart controls, cart links, footer continuity
Wishlist and Compare	15	Wishlist, compare products, recently viewed, email-a-friend controls
User Profile and Account	15	Guest account redirects, register fields, account footer links, account recovery
Address and Shipping	15	Shipping returns, address redirects, delivery/availability text, checkout progress
Checkout and Payment	15	Cart checkout steps, gift card payment fields, product price validation
Customer Support and Information	15	Contact us, sitemap, privacy, conditions, about, news, blog, social links

5. How The Tests Work

- The scenario data file stores route, test name, and expected checks.
- Each service spec loops through its own scenario array.
- The shared runner opens the page and performs each check in order.
- This avoids writing the same navigation and assertion code repeatedly.

6. Reports

After execution, Playwright creates an HTML report and Allure creates a combined project report. The GitHub Actions workflow publishes the Allure report to GitHub Pages so the trainer can open it directly from the browser.

7. Current Result

Item	Result
Website	Demo Web Shop
Functional scenarios	120
Browser projects	Chromium, Firefox, WebKit
Total executions	360

Item	Result
Latest status	360 passed, 0 failed, 0 skipped
